

0,5×2,5 m

GB Capillary matting for green house plants and house plants

- 1 • Cut AquaSorb and a piece of plastic (plastic: + 3 cm), if a draining board is not used.
 - Place AquaSorb on an even surface on top of the plastic.
 - At the end of AquaSorb, fill up the container or the sink with water.
 - Continue with A or B.

A. The simple dispersion of water

- Place one end of AquaSorb into the water.

B. The extra fast dispersion of water

- Cut off a strip of AquaSorb and saturate it.
- Place one end into the water and the other end under AquaSorb (minimum 10 cm). Use several strips, if a large number of plants needs to be watered.

2. Saturate AquaSorb and place the potted plants on top of it. The plants will absorb the required amount of water.
