GB Frost and insect protection

PlantProtect is a light, but yet strong fabric ideal for protecting new as well as existing plants. Due to its lightness, the environmentally-friendly fabric will not damage fragile plants or seeds.

PlantProtect creates a microclimate and allows water, light and air to penetrate. Meanwhile, the evaporation is reduced. The fabric holds the ground's warmth and creates ideal growing conditions for the plants.

- Plant the plants or sow the seeds.
- Place the fabric loosely over the plants or on the ground.
- Secure the ends by pegs. When the plants grow, the fabric will rise concurrently with the plants' growth – without damaging the plants.
- Water directly onto the fabric, since the water will penetrate.
- If the plants need pollination, the fabric should be removed.

PlantProtect is also ideal for protecting trees and plants as well as screening against strong sunlight in a greenhouse.
